
The Problem

The Empire State Building in New York, a 102-floor building, was constructed in just **410 days**. Nearly 90 years later, **One World Trade Center**, a **94-floor building** comparable in size, took **8 years** to complete.

In a world where almost everything has become exponentially faster, **construction is the only major industry that has slowed down instead of speeding up**. Construction productivity has declined across the globe, and the most developed countries face the sharpest challenges. A country like America, with all its vast resources, still struggles to keep pace with many Asian economies in infrastructure development.

This slowdown has become one of the **single biggest problems** for the world. When quantified, it represents a **trillion-dollar market waiting for disruption**, a problem that can only be solved by **automating construction using robots**.

How We Are Solving It

Origin (Formerly known as 10X Construction) is a robotics and AI company with one very simple goal: **to automate the age-old industry of construction**.

Construction relies on highly human capabilities such as mobility, adaptability, spatial awareness, and precise manipulation in environments that are largely uncontrolled. A builder must enter tight spaces, adjust to varying conditions, and build around complex geometry. These complexities have kept construction one of the very few industries that *didn't* get disrupted or revolutionised during the eras of industrialisation, electrification, or even the computer and internet revolution.

But this is about to change.

With recent advancements in **computer vision, machine learning, and AI**, technology is finally mature enough to take on this problem. At Origin, we build **spatially aware autonomous robots** that can manipulate and build

with surgical precision, requiring very minimal inputs. These systems can **see, understand, decide, and execute**, just like a human, but with a purpose-built body designed to reach all heights and corners.

And at Origin, these are not just claims.

We have already deployed three of our autonomous robots in major cities like **New York, Boston, and San Francisco**, as we speak.

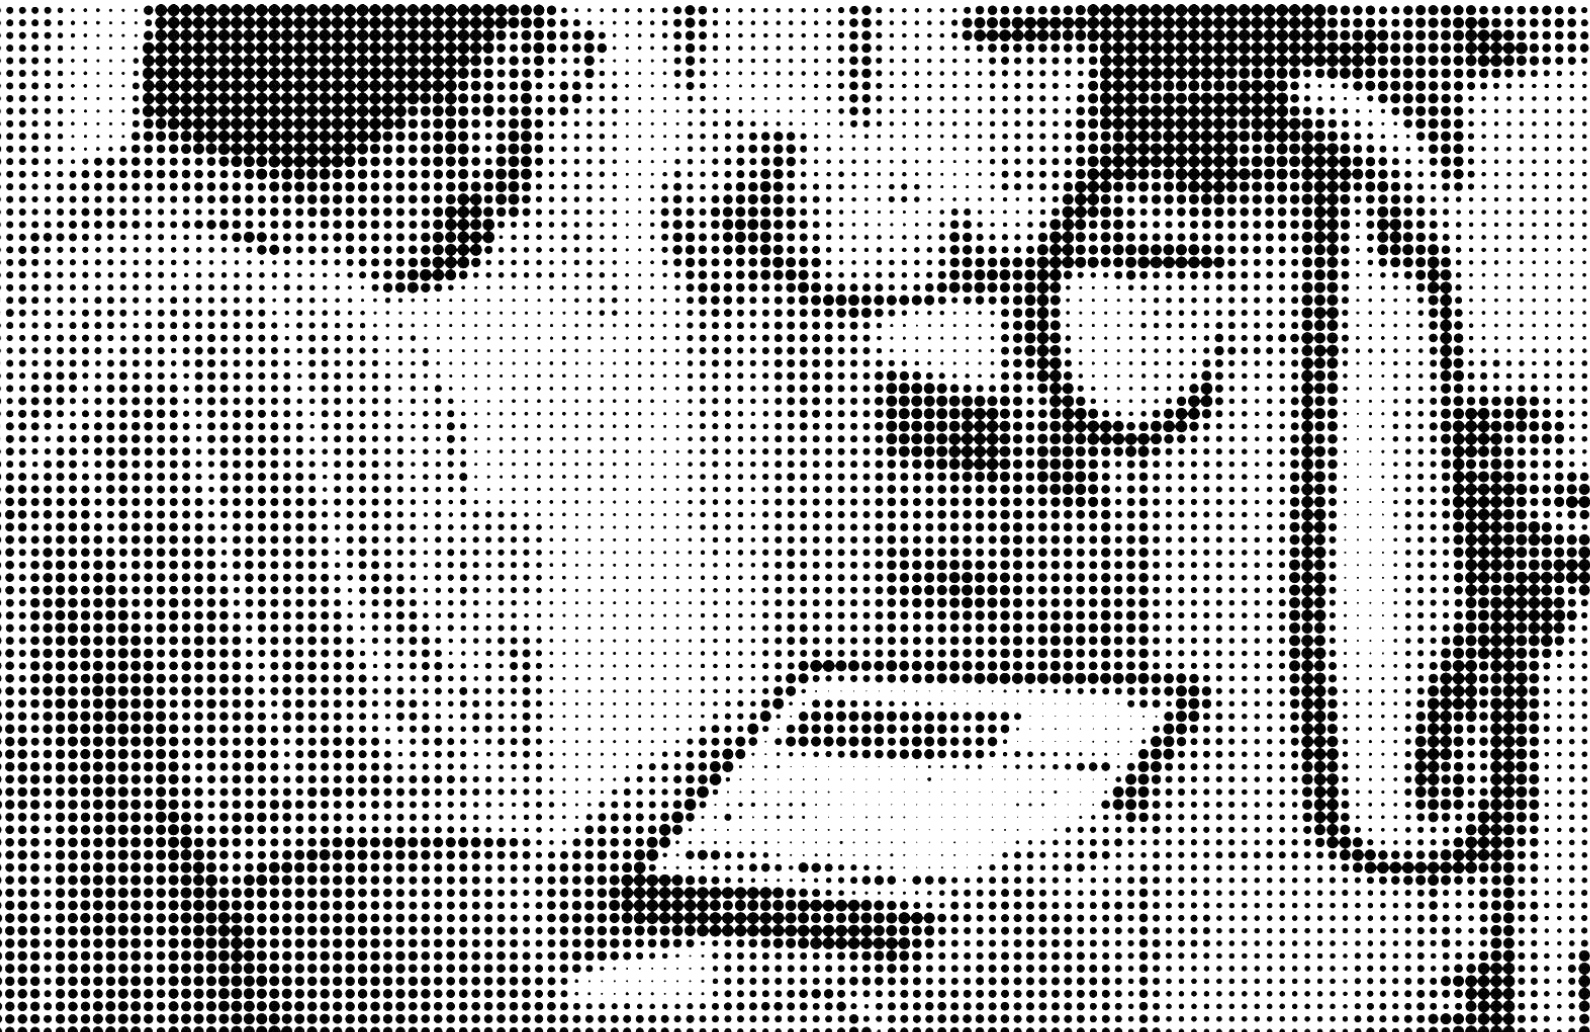
The **United States** being our primary market. We are **headquartered in San Francisco, California**, with engineering and development operations based out of **HSR, Bangalore**.

The company was founded by **three co-founders** with years of experience in building successful startups, inventing in the fields of computer vision and robotics, and leading deep-tech research and development. Our team consists of **high-performing and talented individuals** from some of the world's best institutes, **Stanford, IITs, UCLA, and WPI**, who have spearheaded development in months that normally takes **decades**, designing, developing, and deploying such robots in just **10 months**.

As an **Accel-backed enterprise**, the same early investor behind Facebook, Spotify, and Bumble, we are a company in the right place, at the right time, with the right team, building world-class innovation to solve one of the **biggest hurdles of developed nations**.

And Why You Should Do It Too

Origin is one of the very few opportunities where people work on solving a **real global problem**, not creating an Indian version of an existing solution.

This is for people who have the drive to take on big challenges and build in **one year** what would take their peers **a decade**. It is a chance to work in one of the most dynamic environments, with interdisciplinary teams operating under one roof, united by one goal: **changing the future of how the world builds**.


With **compensation above industry average**, this is not just a job. It is an opportunity to understand what it truly means to build a **once-in-a-generation technology**.
